

Abstract of the Disclosure:

A supporting and wiping device is assigned to the machine wire in a paper-making system. The supporting and wiping device has supporting and wiping strips firmly held on a carrying
5 frame or the like and extending transversely with respect to a direction of movement of the machine wire. The carrying frame has two carrying beams aligned parallel to the supporting and wiping strips and two-part transverse webs arranged between said beams and capable of being fixed to the latter, on the
10 one hand the transverse webs and on the other hand the supporting and wiping strips being formed with mutually associated recesses and projections, by way of which the transverse webs and the supporting and wiping strips can be connected to one another and clamped by displacing the two
15 parts of the transverse webs with respect to each other..
